Code forces question :

Three Parts of the Array - Solution

The screenshot shows a web browser displaying a Codeforces submission page. The URL is `codeforces.com/submissions/sgkothakonda11`. The submission is for problem (C) 'Three Parts of the Array' from Codeforces Round 490 (Div. 3). The submission status is 'Accepted' and the code is in Java. The submission time is 0 ms and the memory usage is 0 KB. The code is a Java program that reads an array of integers and finds the maximum value of $\min(a, b, c)$ where a , b , and c are the sums of the first, middle, and last parts of the array respectively. The code uses a two-pointer approach to find the optimal split points.

```
import java.util.*;
public class Main{
    public static void main(String args[]){
        Scanner sc=new Scanner(System.in);
        int n=sc.nextInt();
        int arr[]=new int[n];
        for(int i=0;i<n;i++){
            arr[i]=sc.nextInt();
        }
        long ans=0;
        long leftsum=0;
        long rightsum=0;
        int left=0;
        int right=n-1;
        while(left<right){
            if(leftsum>rightsum){
                leftsum+=arr[left];
                left++;
            }
            else{
                rightsum+=arr[right];
                right--;
            }
            if(leftsum==rightsum){
                ans=Math.max(ans, leftsum);
            }
        }
        System.out.println(ans);
    }
}
```
